

Brainstorming

The Food Ordering Behavior Analysis Using Tableau project was developed to understand customer ordering patterns and provide meaningful business insights through interactive data visualization. During the brainstorming phase, several ideas were explored to identify the most useful information that could help restaurants and food delivery businesses improve their services.

The project focuses on analyzing customer preferences based on cuisine types, meal categories, cities, payment methods, ordering frequency, ratings, and order values. Interactive dashboards allow users to filter data by different categories and compare trends easily. The visualizations help identify popular cuisines, peak ordering periods, customer satisfaction levels, and preferred payment methods.

The main objective of brainstorming was to determine how raw food ordering data could be transformed into clear, interactive dashboards that support data-driven decision-making. By presenting complex data in a simple visual format, businesses can better understand customer behavior and improve operational efficiency.
