

## **Define Problem**

Food delivery businesses generate a large amount of customer order data every day. However, this data is often stored in spreadsheets or databases without proper visualization, making it difficult to identify trends and customer preferences. As a result, businesses may struggle to understand which cuisines are most popular, when customers place the most orders, which payment methods are preferred, and how customer ratings affect overall performance.

The Food Ordering Behavior Analysis Using Tableau project addresses this challenge by converting raw data into interactive dashboards. The project enables users to explore ordering behavior, compare different categories, and identify important business trends. This helps organizations make informed decisions, improve customer satisfaction, optimize services, and enhance overall business performance.
