

Proposed Solution

The proposed solution is to develop an interactive Tableau dashboard that provides a comprehensive analysis of food ordering behavior. The project begins by collecting food ordering data from a structured dataset. The data is then cleaned, validated, and transformed using Microsoft Excel to ensure consistency and accuracy before importing it into Tableau.

Using Tableau Public, multiple dashboards are designed to display key business metrics and customer behavior. The dashboards include visualizations for total orders, revenue, customer ratings, city-wise analysis, cuisine popularity, meal type distribution, payment methods, and ordering frequency. Interactive filters and parameters allow users to customize the analysis according to their requirements.

The proposed solution makes complex business data easy to understand and helps organizations identify trends, improve operational efficiency, enhance customer satisfaction, and make informed business decisions. It also provides flexibility for future enhancements by allowing additional datasets and new visualizations to be integrated into the dashboard.
