

Project Development

Introduction

The Food Ordering Behavior Analysis Using Tableau project was developed to analyze customer food ordering behavior using interactive data visualization. The project transforms raw food ordering data into meaningful insights, enabling businesses to understand customer preferences, identify ordering trends, and make informed business decisions. Tableau Public was used as the primary visualization tool because of its powerful dashboard creation and interactive analytical features.

Development Process

1. Data Collection

The project began by collecting a food ordering dataset containing customer information, order details, cuisine types, meal categories, payment methods, ratings, cities, order values, and order dates. The dataset served as the foundation for the entire analysis.

2. Data Preparation

The collected dataset was cleaned using Microsoft Excel. Duplicate records were removed, missing values were handled, unnecessary columns were eliminated, and data formatting was standardized. This ensured that the dataset was accurate, consistent, and ready for visualization.

3. Dashboard Development

The cleaned dataset was imported into Tableau Public. Multiple worksheets were created to visualize different aspects of customer ordering behavior. Interactive dashboards were then designed using various charts, KPI cards, filters, parameters, maps, and navigation buttons. These dashboards allow users to explore data from different perspectives.

4. Dashboard Features

The project includes several interactive features to improve user experience and analysis. Users can filter data by city, cuisine type, meal type, and payment method. KPI cards display important business metrics such as total orders, revenue, and average customer ratings. Navigation buttons enable smooth movement between dashboards, while interactive charts help users compare different categories and identify trends quickly.

5. Business Insights

The dashboards provide valuable insights into customer behavior, including the most popular cuisines, preferred meal types, commonly used payment methods, peak ordering periods, and city-wise ordering trends. These insights help restaurant owners and business managers understand customer preferences, improve marketing strategies, optimize menu planning, and enhance customer satisfaction.

Technologies Used

- Tableau Public
- Microsoft Excel
- Microsoft Word
- GitHub
- SQL (for data preparation, if applicable)

Project Outcome

The Food Ordering Behavior Analysis Using Tableau project successfully converts raw food ordering data into interactive and visually appealing dashboards. The project enables businesses to monitor customer ordering behavior, evaluate business performance, and make data-driven decisions. The dashboards are easy to use, responsive, and capable of presenting complex information in a simple and understandable format.
