

Planning Logic

Introduction

The Food Ordering Behavior Analysis Using Tableau project follows a structured planning approach to ensure the successful completion of all project activities. The project is divided into multiple phases, including data collection, data preparation, dashboard development, testing, and documentation. Each phase is planned carefully to achieve the project objectives within the given timeline.

Planning Process

1. Requirement Identification

The first step is to understand the project objectives and identify the business requirements. The required food ordering dataset is collected, and the key attributes such as customer details, cuisine type, meal type, payment method, ratings, city, and order amount are identified for analysis.

2. Data Collection

A suitable food ordering dataset is selected. The dataset contains all the necessary information required to analyze customer ordering behavior and generate meaningful business insights.

3. Data Preparation

The collected data is cleaned using Microsoft Excel by removing duplicate records, handling missing values, correcting formatting issues, and validating the dataset. This ensures that the data is accurate and ready for visualization.

4. Dashboard Development

The cleaned dataset is imported into Tableau Public. Interactive dashboards are created using charts, graphs, KPI cards, maps, filters, and parameters. Different dashboards are designed to analyze cuisine preferences, meal types, payment methods, customer ratings, city-wise orders, and ordering trends.

5. Testing and Validation

The dashboards are tested to ensure that filters, parameters, navigation buttons, and visualizations function correctly. The accuracy of calculations and data representation is also verified.

6. Documentation and Deployment

After successful testing, the project documentation is prepared, including reports, screenshots, diagrams, and supporting documents. Finally, the complete project is uploaded to GitHub for submission and future reference.

Project Workflow

Requirement Analysis → Data Collection → Data Cleaning → Dashboard Design → Dashboard Testing → Documentation → GitHub Submission

Expected Outcome

The project provides interactive dashboards that help users understand customer ordering behavior, identify business trends, and support data-driven decision-making. The planning process ensures that every stage of the project is completed efficiently, resulting in an accurate, user-friendly, and well-documented Tableau dashboard.
