

Data Flow Diagram (DFD)

The Food Ordering Behavior Analysis Using Tableau project follows a simple data flow process. Initially, food ordering data is collected from the dataset, which contains information such as customer details, order date, city, cuisine type, meal type, payment method, ratings, and order amount.

The collected data is cleaned and prepared by removing duplicate records, handling missing values, and formatting the data correctly. The processed data is then imported into Tableau, where dashboards and visualizations are created using charts, graphs, filters, and parameters.

Users interact with the dashboards to analyze customer ordering behavior, identify popular cuisines, compare cities, study payment methods, and observe ordering trends. The final output provides meaningful insights that help businesses make informed decisions and improve their services.
